

## Installation of JQuery Plugin Hover Effect.

Begin by creating an unordered list of images in your html file. Each li item in the list must have the class "container" and each img should have an alt attribute, this will determine the caption under each image. In your html file you need 3 scripts. "jquery-3.6.0.min.js", "jquery.hoverEffect.js", and the .js file you wish to use the plugin. Next copy the css file and link it to your html.

To use the plugin, use a selector to select your under ordered list and call .imageHover(). From here you can customize the following settings for your plugin. The change in opacity of the images, the change in the height and width of the images, and the duration which the animation takes place.
